

Green skilling

Presented by

Name: Pandya Rishi Kanaiyalal

Enrollment No.:230610107025

Stream: Computer Engineering

College: Government Engineering College Palanpur

- **What is Green skilling?**

Green skilling means learning skills that help protect the environment and support sustainable development.

It reduces pollution in our day by day life and supports economic growth.

It helps to achieve climate goal because after the greed of human society to develop more and more they affected the earth rapidly.

Green Skilling also provides jobs in many sectors

Some of the examples of Green Jobs are:

1. Solar panel technician
2. EV maintenance engineer
3. Waste management specialist etc..

- Sustainability

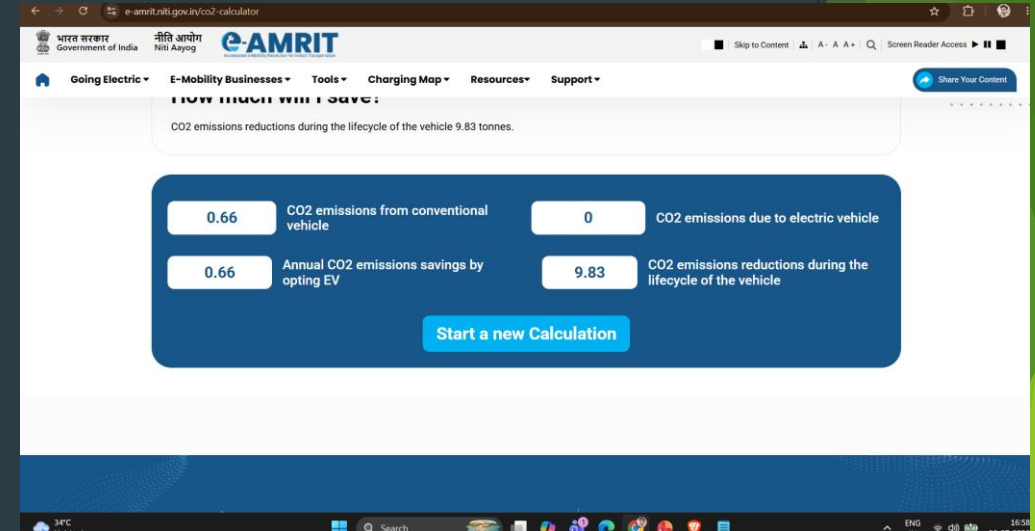

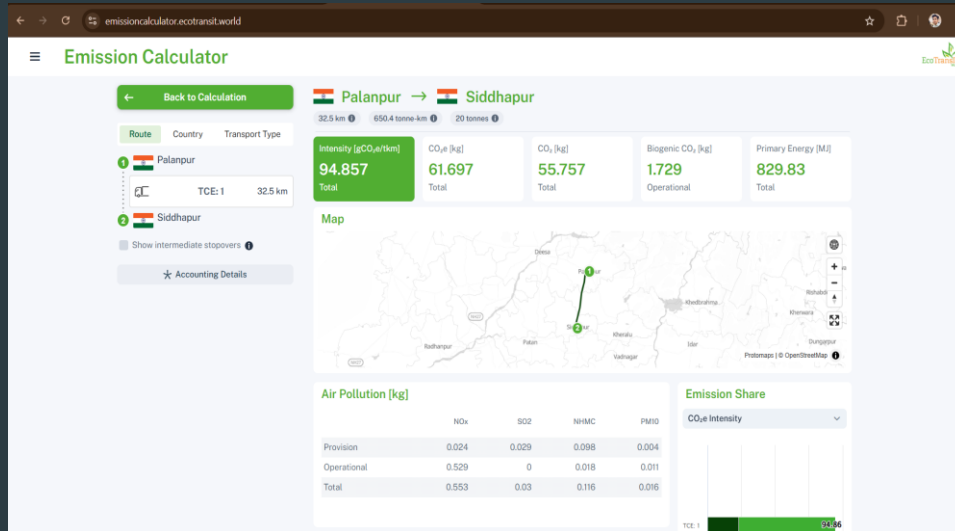

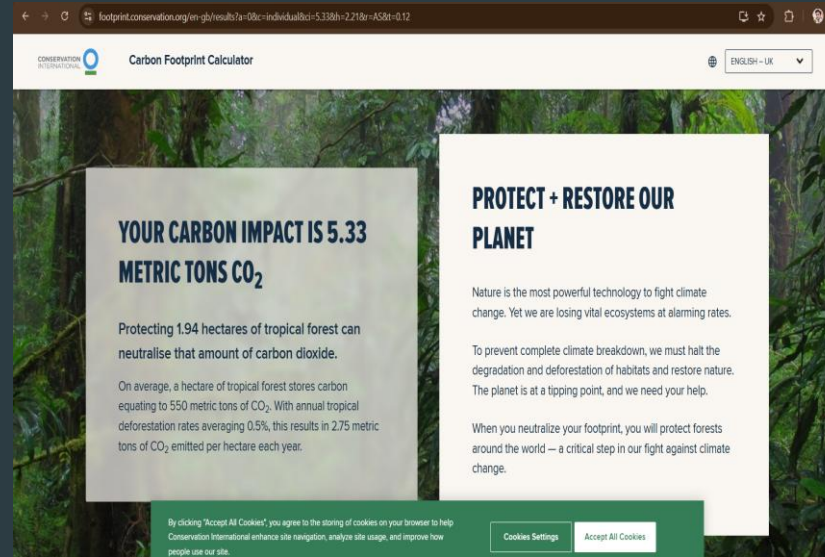

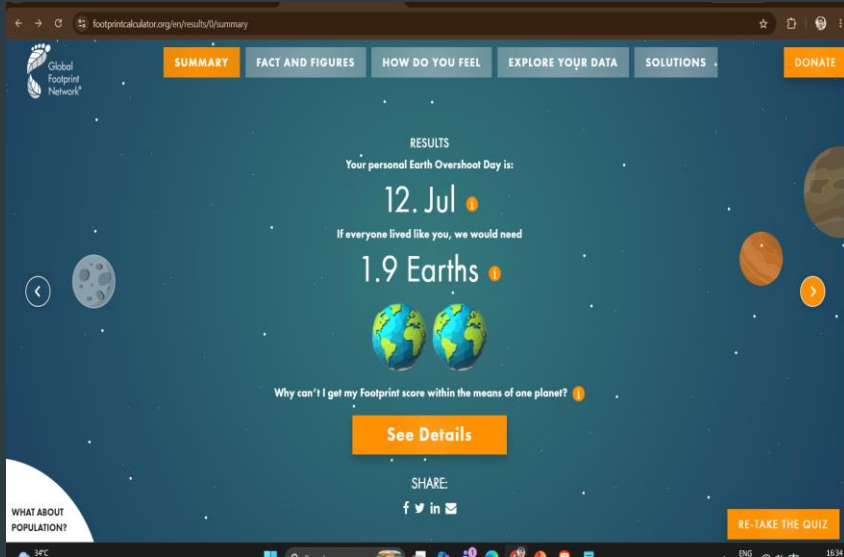

Sustainability means using resources carefully so that future generations can use them too

There are main three pillars of the Sustainability:

1. Environmental - Protecting nature by reducing pollution, saving resources, and preserving ecosystems.
2. Social - Improving people's quality of life through health, education, equality
3. Economic - Supporting business growth and economic development while using resources responsibly and carefully.

In today's digital world Sustainability is in big danger like these data centres are using too much of energy and water as cooling system.

Activities

- **Current Sustainability Projects**

There are some current Sustainability Projects nowadays like

1. Renewable Energy:

Solar Power
Wind Energy

2. Smart Technologies:

AI-based waste monitoring
Electric Vehicles
Energy-efficient Data Centres

3. Resource Management:

Rainwater harvesting
Recycling
Green buildings

AI Smart Bins: Smart waste bins that use Artificial Intelligence to identify and manage waste for better recycling.

Ecological Calculator : A tool that measures how much land and natural resources your lifestyle uses.

Carbon Calculator : A tool that estimates the amount of carbon dioxide emissions produced by daily activities.

Pros & Cons of AI

Pros of AI

Automates repetitive tasks, improving efficiency.

Analyzes large amounts of data quickly and accurately.

Supports healthcare with faster diagnosis and personalized treatment.

Optimizes energy use and resource management for sustainability.

Improves decision-making through predictive analytics.

Enhances productivity in industries such as agriculture, manufacturing, and logistics.

Cons of AI

May replace certain jobs through automation.

Can produce biased results if trained on biased data.

Raises concerns about data privacy and security.

High development and maintenance costs.

Requires significant computational power, increasing energy consumption.

Overdependence on AI may reduce human decision-making skills.

- Capstone Project

Title :- Energy Consumption Prediction

Problem Statement :- People often waste electricity because they cannot predict or monitor their energy consumption effectively.

Artificial Intelligence analyzes historical electricity usage data to predict future energy consumption. Based on these predictions, it helps users make better decisions to reduce energy usage.

Thank you
